

BOTANICAL CHART;

CONCISE INTRODUCTION TO THE LINNÆAN SYSTEM OF BOTANY.

By JAMES RATTRAY, Surgeon, AND LECTURER ON BOTANY, GLASGOW.

A New Edition, Mebised, Corrected, and greatly Enlarged.

BOTANY is that science which teaches us to distinguish one Plant from another; and consists in associating together, into classes, or groups, such Plants | Seed-vessels may be nearly ripe, and, if possible, one entire specimen of the Plant. Determine first whether the flower is male, female, or hermaphrodite; situation, number, proportion, and connection of the various parts of a Plant.

When a Plant is taken up for examination, it is an object to obtain several flowers—some of them fully expanded, some just opening, others whose

as possess certain permanent characters in common, and in separating and distinguishing those that are dissimilar in characters and appearance, by fixed rules then, from the number, insertion, proportionate lengths, and connection of the Stamens, the Class to which the Plant belongs (by looking at the characters of the Classes in the Key annexed) will be easily found out; and, by counting the number of the Pistils, observing whether the Seeds are naked or covered, and Kingdom. The purpose of this Tabular Scheme, besides giving the Nomenclature of Botany, is to guide the Student, in the clearest and concisest manner, leading the Student, in the clearest and concisest manner, leading the Student, in the clearest and concisest manner, leading the Student, in the clearest and concisest manner, leading the Student, in the clearest and concisest manner, leading the Student, in the clearest and concisest manner, leading the Student, in the clearest and concisest manner, leading the Student, in the clearest and concisest manner, leading the Student, in the clearest and concisest manner, leading the Student, in the clearest and concisest manner, leading the Student, in the clearest and concisest manner, leading the Student, lea to an intimate acquaintance with the Anatomy of a Plant, the functions of its particular parts, and the elucidation of the most accurate and elegant mode | Genera will be found arranged and grouped together into several sections, by certain very obvious marks of distinction. The specific characters follow, arranged of arrangement ever offered to the world by the genius of man; which system, or mode of arrangement, is founded upon characters drawn from the figure, in a similar manner. These divisions and subdivisions, by lessening the labour, greatly facilitate the study of Botany, and will soon enable the student to " Find tongues in trees, books in the running brooks,

Sermons in stones, and good in every thing."

Plants, in general, are composed of Root, Stem, Inflorescence, Fulcra, Flowers, and Fruit. A short description of the different Parts, with the Varieties met with among Vegetables, follows:-

ROOTS.

to suppose that the Roots of all Plants possess similar functions.

a continuation of the vessels which convey the rourishment of the Plant into the system | ceous, fleshy, or firm, smooth or rough. The Trunks of Trees and Shrubs are composed assume, such as the of circulation. The solid portion of the Root is similar in composition and structure to of a Medulla or Pith, the Lignum or solid wood, and the Alburnum, when the flowers are thickly set upon a slender foot-stalk, with intervening the Stem: and although the chemical changes which the imbibed juices undergo in the of wood: covered with three different coats of bark, -viz. the Liber, the Cortex, and Root may not be fully understood, yet the wonderful changes which these juices experience | Epidermis. in passing through the vascular system of the Plant are evident, and point out the importance of the Root in the economy of the vegetable.

The various kinds of Roots are, the

Articulatus, when the root is jointed, as in Wood Sorrel. Bulbus, buds under ground. They may be scaly-coated, net-like, solid, lateral, double, | Culmus, the proper stem of grasses, it may be simple or branched, knotted or knotless, compound, as in Lilium, Alium, &c.

Dentatus, when fleshy branched roots have tooth-like processes. Coral-rooted Ophrys. Fibrosus, when the root consists of a number of small fibres. Poa. Fusiformis, when spindle-shaped, tapering gradually like the Carrot. Granulatus, forming small round bodies, as in Saxifraga granulata. Horizontalis, when lying horizontally on the ground, as in Polypodium. Napiformis, when the knobs are round like the Common Turnip. Palmatus, hand-shaped, divided into three or more longish knobs. Orchis latifolia. Præmorsus, when the Caudex appears as if bitten off, as in Devil's Bite. Ramosus, when divided into many branches, as in most trees, &c. Repens, creeping under the surface of the earth, and at intervals pushing up stems. Squamosus, when the Caudex is covered with scales. White Lily.

ing or climbing; they may be naked or covered with leaves, scaly or covered with bulbs, character to found specific distinction upon. The small Fibres, or true roots, consist nearly of cellular substance; and are seemingly &c. In figure, they may be round or angular, compressed or half-round, woody, herba-

Botanists have enumerated the following kinds of Stems: the

Caulis, peculiar to herbaceous plants, the principal stem elevating the leaves, flowers, &c. Confertus, branches thick set or crowded without order. Coractatus, rising at acute angles from the stem, and sweeping nearly close up by it.

bristle-like, with or without a sheath. Dichotomus, the branches dividing regularly and repeatedly into pairs. Missletoe. Fastigiatus, the branches at the bottom rising to an equal height with those at the top of

Frons, when the stem, leaf, and fructification are united. Ferns. Pedunculus, the flower-stalk, supporting only flowers. Petiolus, the leaf-stalk, bearing only leaves. Scapus, a stem elevating the flowers only, as in the Lily of the Valley, &c. Seta, the stem which bears only the fructification of mosses. Stipes, the stems of ferns, mushrooms, palms, and the pappus of some seeds. Surculus, the stem which bears the leaves of the mosses.

When Plants want the Stem altogether, they are termed Planta Acaule.

INFLORESCENCE.

Small Fibres: it is commonly fixed in the earth, and imbibes the principal nourishment | Vegetable; and may be either simple or branched. The Branches may be either simple or branched. The Branches may be either simple or branched. The Branches may be either simple or branched. of the plant from the soil. The Roots of some Plants exhale or give out certain excre- or alternate, scattered or close, compact or spreading, diverging or divaricated, reflected, Plants, as the mode of Inflorescence seldom or never varies in any one species; although Leaves, and Flowers, such as the mentitious matter, which impregnates the surrounding soil, and has led some Physiologists | deflected, or retroflected. Stems may be bent or procumbent, straight or twining, creep- | the number of the Flowers, in any of the following modes, would be a very uncertain

Under this term are comprehended the various modes of arrangement which Flowers

scales, as in Hazel, Birch, Oak, &c. Capitulum, when a number of flowers stand thick on one stalk, either of a spherical or

roundish form, like a head. Corymbus, when the foot-stalks of a Racemus are lengthened out to a flat surface. Iberis. Chirrus, a tender, twisted, thread-like body, which serves weak plants to clasp other Cyma, a number of branched foot-stalks rising from a common point, as in Elder, &c.

Fasiculus, an irregular cluster or bundle, as in Sweet-William. Panicula, when a number of flowers are standing on long foot-stalks, unequally divided, as in Poa and many of the Grasses.

Racemus, when every flower has a short foot-stalk, as in the Currant, &c. Spadix, when all the flower-stalks are contained in a vagina-peculiar to Palms, and some

few other plants. Spicula, when a number of flowers have only one Calyx-peculiar to Grasses. Spica, a spike, a number of flowers without foot-stalks sitting on the stem. Wheat.

Thyrsus, when a panicle is condensed into an ovate form, as in Privet. Umbella, a number of flower-stalks, of one length, issuing from a common centre, like the radii of a circle, as in Hemlock, &c.

Verticillus or Whirl, when flowers encircle the stem in rings. Mentha. Peculiar to Mosses.

Flos Capituliformis, formed like a little head or sphere. Flos Disciformis, the flower formed like a star, as in Polytrichium. Flos Gemmiformis, when the figure of the flower is like a swollen bud.

THE RADIX or ROOT consists of two parts—the Caudex or Stock, and the Radiculæ or The Stem is the principal trunk or body which supports the branches, leaves, &c. of a Inflorescentia or Inflore

Aculeus, a prickle, formed from the bark, as in the Rose, Briar, &c.

Ampula, a hollow bladder, found at the roots of some water plants. Utricularia. Annulus, a thin membrane, like a ring, surrounding the stalk of the fungi. Arista, the awn or pointed beard of some of the Grasses.

Ascidium, a cylindrical hollow leaf, containing water, sometimes completely covered, opening occasionally. Nepanthes. Bractea, floral leaves, situated among the Howers, generally differing in shape and colour

from the leaves of the plant. Orchis.

bodies for support. Vine. Gemma, the bud which contains the embryo of the leaves and flowers.

Glandula, a round body which either secretes or transpires fluids. Gongylus, round hard body in the fuci, which, on the death of the old plant, becomes a new one. Indusium is a thin membrane which covers the flowers or seeds of ferns.

Ligula, a small transparent strap, situated on the margin of the vagina, and at the base of the leaf. Poa.

Ochrea, a leaf-like body, surrounding the flower-stalks of some grasses. Pileus is the cap or top of a mushroom, supported by the stalk. Pilus, a slender fine body, like a hair, covering some plants.

Propago is the bud of mosses, which Linnaus considers as the seed. Ramentum, small bristle-shaped, brown-coloured, thin leafets, without order on the stem, as in Fir, &c.

Spina, a thorn, formed from the woody part of the plant. Cockspur Thorn. Stipulæ, small leaves or scales situated at the base of some of the foot-stalks of leaves. Viciæ, Lathyrus.

Vagina, the prolongation of a leaf which rolls itself round the stem. Bistort.

THE LEAVES are organs in a Vegetable, possessing functions nearly analogous to those of | Caulinum, when attached to the principal stem. the lungs of Animals, affording an extended surface for the absorption and transpiration | Carnosum, fleshy, when there is a pulpy soft substance, as in Houseleek. of air and moisture; and they likewise give shade to the Vegetable.

Testiculatus, when two egg-shaped knobs grow together. Orchis Moria.

Tuberosus, when fleshy knobs adhere to the Caudex or to the fibres. Dropwort.

The Leaves are a continuation and expansion of the same vessels and matter which compose the Root, Stem, Branches, and Foot-stalks; and, in many plants, show their wonderful susceptibility of certain stimuli, exhibiting the most striking phenomena in changing their direction by the contraction or elongation of their fibres. They may be simple or compound; and are distinguished and denominated from their connection, situation, figure, substance, position, direction, or attachment. On examining a simple leaf, its base and apex, its circumference and margin, its upper and under surfaces, its substance and situation, must be considered; and are termed,

Acerosum, needle-shaped, a rigid linear leaf like the Pinus. Acuminatum, when the point is lengthened out.

Axillare, when standing at the origin of the branch.

Acutum, acute, when tapering gradually to a point.

Auriculatum, ear-shaped, nearly hastate, but the lobes rounded and smaller. Angulare, of various angles. Avenium, having no veins.

Anceps, when a compressed leaf is sharp on both edges. Acinaciforme, shaped like a scymitar, a thick leaf with one side sharp and the other broad. Fasiculata, when the leaves stand in tufts, as in Larch, &c. Alterna, when placed alternate.

Amplexicaule, when the lobes of a sessile leaf embrace the stem. Adpressum, when the upper surface is pressed upwards to the stem.

Bulatum, when the parts raised between the veins are like blisters. Cordatum, heart-shaped. Lamium album.

Cuneiforme, when blunt-pointed, it tapers to the base like a wedge. Cuspidatum, when the acuminate leaf ends in a bristle. Capillare, when scarcely any breadth, like a hair.

Adversum, when the margin is turned towards the stem.

Cartilaginum, when the margin is harder than the disk of the leaf. Crenatum, notched, with small teeth, whose points stand at right angles with the mid rib. | Lanceolatum, shaped like a spear, gradually narrowing to the point. Ciliatum, fringed with long hairs, distant from each other.

Concavum, hollow in the middle of the leaf. Canaliculatum, when the mid rib is furrowed or channeled.

Crispum, when fuller on the margin than the middle, the former curled. Carinatum, when the mid rib is formed like the keel of a ship. Cucullatum, when rolled up like a hollow cone, or like a sugar paper.

Truncus, the main stem or trunk of trees and shrubs.

Compressum, compressed, when a thick leaf is flattened on both sides. Conferta, when so crowded that the stem cannot be seen. Connatum, when opposite sessile leaves are closely united at their base into one substance Decurrens, when the substance of the leaf runs down the stem. Dædaleum, when the apex has a large circuit, but is cut off and ragged.

Dentatum, when small distinct separate teeth are placed on the margin. Depressum, when the upper and under surfaces of a fleshy leaf are pressed together. Dolabiforme, when a fleshy leaf is compressed and shaped like an axe. Deltoides, when short and bounded by three broad surfaces, like the letter delta. Disticha, when the leaves stand in two rows, as in Yew and Pitch Fir.

Decussata, when set in four rows, forming a St. Andrew's cross. Dependens, when the base turns to the zenith and the apex to the earth. Demersum, when the leaves are found below water. Emarginatum, when blunt-pointed and notched deeply, a portion taken out.

Enervium, when no nerves rise from the base, nerveless. Ensiforme, sword-shaped, like the Iris. Erectum, when the leaf forms a very acute angle upwards with the stem. Erosum, gnawed, unequally sinuated, as if bitten at the edges.

Fissum, cleft, when merely cut into the leaf. Flabelliforme, when shaped like a fan.

Florale, when standing close by the flower. Gibbosum, when both surfaces are convex, or seem swelled out. Horizontale, when the upper surface of the leaf makes a right angle with the stem. Imbricatum, when one leaf overlaps another, like tiles on a house.

Inaquale, unequal, when one lobe is larger than the other. Incurvum, when bent in at the point towards the stem. Lacunosum, when the surface is hollow between the veins, pitted. Laciniatum, torn, when there are several irregular clefts in an oblong leaf.

Lineatum, streaked with depressed but not always parallel lines. Lineare, of equal breadth from the base to the apex, margins nearly straight. Linguiforme, when a compressed leaf is somewhat tongue-shaped. Lobatum, deeply divided into lobes.

Lunatum, moon-shaped, like the moon in her third quarter. Lyratum, lyre-shaped, when the extreme segment of any of the two former is large and round. Spinosum, when set with spines as in the Thistle.

LEAVES.

| Membranaceum, like a membrane, when without any pulpy substance. Mucronatum, when a blunt-ended leaf ends in a bristle. Natans, when the leaf swims, as in Water Lily.

Nervosum, when the vessels run in parallel lines from base to apex. Obliquum, when in a direction between horizontal and perpendicular. Obtusum, when the end of the leaf is blunt.

Opposita folia, when the leaves are set opposite. Orbiculatum, when the circumference is in all points at equal distances from the centre. Ovatum, egg-shaped, nearly oval, but the diameter greater at the base than at the apex. Paleaceum, when the foot-stalk is attached to the margin.

Palmatum, when more than half-way divided into five or six finger-like lobes. Panduriforme, fiddle-shaped, having a deep curve or bay on both sides of an oblong leaf. Parabolicum, a quadrangular figure, with two obtuse and two acute angles.

Petiolatum when a leaf has a foot-stalk. Peltatum, when the foot-stalk is inserted into the disk of the leaf. Pinnatifidum, when the incisures or bays go almost down to the mid rib. Planum, when the upper surface forms an even plane.

Plicatum, when the leaf is laid in regular folds. Premorsum, when the point seems as if bitten off.

Punctatum, dotted, having dots or points instead of veins or ribs. Radicale, when they spring from the root, as in Viola odorata. Radicans, when the leaf strikes roots.

Ramosum, when rising from the branches. Reclinatum, when standing with its point towards the earth. Remota, when separate from one another by considerable interstices. Reniforme, kidney-shaped. Ground ivy.

Reticulatum, when the veins are like net-work. Repandum, serpentine, small sinuses without angles on the margin-Retusum, slightly and bluntly notched at the end. Revolutum, when rolled backwards with its point to the stem.

Rugosum, wrinkled, when the surface is raised between the veins. Runcinatum, when the incisures of a pinnatifid leaf are pointed and bent downwards. Sagitatum, arrow-shaped, the lobes pointed and bent outward like barbs. Seminale, when they grow out of the seed lobes when germinating

Serratum, when the point of the teeth are turned to the apex like a saw. Sessile, when fixed to the stem, and there is no foot-stalk. Sinuatum, sinuated, when shallow bays are cut out of the margin

Sparsa, when they stand thick on the stem, scattered without order. Squarroso Laciniatum, when the incisures run in every direction, as in the Thistle. Stellata sive Verticillata, when several are set star-like round the stem. Subulatum, awl-shaped, a linear leaf sharply pointed. Teres, round, when formed like a cylinder. Terna, when three leaves stand round the stem. Tetragonum, when a long leaf is bounded by four narrow surfaces. Triquetrum, three-sided, when bounded by three narrow long sides. Truncatum, when the point of a leaf is cut off or ends in a straight line. Tubulosum, when hollow within, as in the leaves of the Onion. Undulatum, waved, when the margin is bent upwards and downwards. Uncinatum, when a leaf has a hook-shaped appearance. Venosum, when the fibres are branched from the mid rib. Verucosum, warty, having little lumps or warts on the surface. Verticale, perpendicular, forming a right angle with the horizon.

When there are several leaves on one foot-stalk, they are termed Compound Leaves .-Under the following kinds will be found most of the varieties which compound leaves assume, with regard to arrangement.

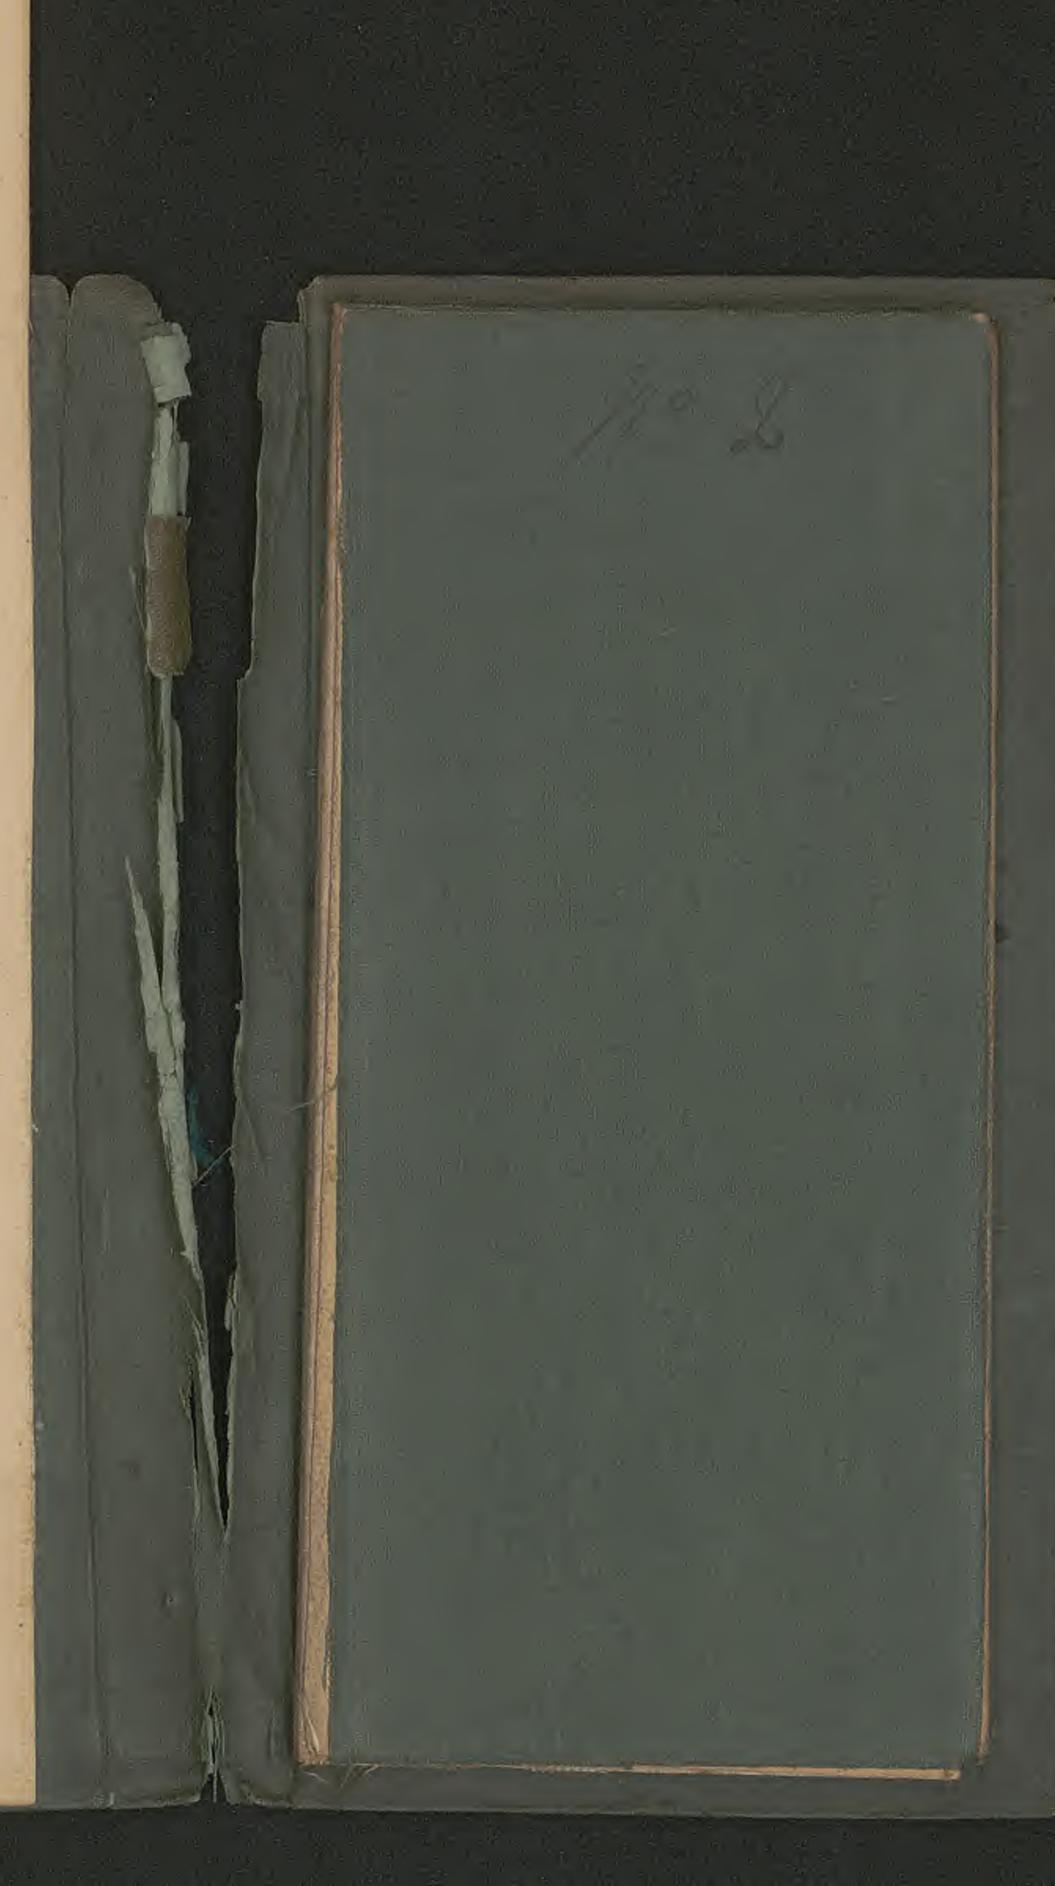

Bigeminatum, when a divided leaf-stalk bears two leaves at each point. Binatum, when the leaves stand in pairs. Bipinnatum, double pinnated.

three, these nine points bearing each three leaves.

Biternatum, when a foot-stalk separates into three, bearing three leaves on each point. Conjugato pinnatum, when a foot-stalk divides, and each pair makes a pinnated leaf. Decompositum, when the primary leaf-stalk divides, each division forming a compound leaf. Digitatum, when the base of several leaves rest on one kindred foot-stalk. Digitato pinnatum, when four or five simply pinnated leaves are fixed to one stalk. Patens, when expanding in a direction nearly horizontal.

Pedatum, when there is some resemblance to the foot of a bird, as in Black Hellebore. Pinnatum, winged, when a series of leafets, on the same plane, are fixed to one foot-stalk. Quinatum, when five leaves are fixed to one foot-stalk.

Supra Decompositum, when more than doubly compound. Ternatum, when three leaves are supported on one foot-stalk. Trigeminatum, when the former has two leaves at the division of the principal stalk. Tripinnatum, when several doubly pinnated leaves are fixed to one common foot-stalk. Triternatum, when a foot-stalk is divided into three, at each point again divided into

THE Parts of Fructification are seven in number _viz. the CALYX, COROLLA, STAMINA, PISTILLUM, PERICARPIUM, SEMEN, and RECEPTACLE. These parts of the Flower when the latter, the stamens are five afford the most permanent marks or characters of distinction; and may indeed be looked upon as so many vegetable letters inscribed on the physiognomy of plants by the hand in number, united by their anthers round one pistil. The compound flowers naturally associate themselves into three distinction; and may indeed be looked upon as so many vegetable letters inscribed on the physiognomy of plants by the hand in number, united by their anthers round one pistil. of God—the knowledge of which may be acquired with ease and celerity; and, when rightly understood, will lead, with safety and certainty, to the true knowledge of that most florets are all Tubular and of equal length, as in Tansy; Semiflosculosi, when all the florets are all Tubular and of equal length, as in Tansy; Semiflosculosi, when all the florets are all Tubular and of equal length, as in Tansy; semiflosculosi, when all the florets are all Tubular and of equal length, as in Tansy; semiflosculosi, when all the florets are all Tubular and of equal length, as in Tansy; semiflosculosi, when all the florets are all Tubular and of equal length, as in Tansy; semiflosculosi, when all the florets are all Tubular and of equal length, as in Tansy; semiflosculosi, when all the florets are all Tubular and of equal length, as in Tansy; semiflosculosi, when all the florets are all Tubular and of equal length, as in Tansy; semiflosculosi, when all the florets are all Tubular and of equal length, as in Tansy; semiflosculosi, when all the florets are all Tubular and of equal length, as in Tansy; semiflosculosi, when all the florets are all Tubular and of equal length, as in Tansy; semiflosculosi, when all the florets are all Tubular and of equal length, as in Tansy; semiflosculosi, when all the florets are all the fl when, like the Mountain Daisy, the florets in the centre are Tubular and those in margin Ligulate. They are distinguished into genera by the figure and leaves of the extended volume of Nature's productions, the Vegetable World.

Flowers are either single or double, simple or compound. A flower is said to be single when all its parts are distinct and natural; double, when these become monstrous, calyx, by the structure and appearance of the Receptacle, and by the presence or absence of down or chaff on its surface, or on the seeds. multiplied, mutilated, or deformed. When a calyx contains only one set of stamens and pistils, &c. it is a simple flower; when a number of florets are contained within one

and retain in their proper situation, the less hardy but more essential organs of fructifica- petalous, and Polypetalous. When a flower becomes double, it is a monster. tion: it differs as to situation, figure, and number of its parts, and is termed accordingly, from its varied appearances,-

CALYX

Abbreviatus, when considerably shorter than the corolla.

Amentum, catkin, chaffy-like scales, among the flowers, as in Hazel, Willow, &c. Anthodium, or Calyx communis, is a calyx which contains a number of little florets, so as, in appearance, to constitute only one flower, as in the Mountain Daisy, &c.

Caducus, falling off before the flower. Papaver Somniferum. Calyculatus sive Auctus, a calyx, having a calyx or little cup at the base, as in Dianthus, Dandelion, &c.

Calyptra, a veil, like an extinguisher, as in some Mosses. Gluma, a husk, the chaff of Oats, Barley, Wheat, and most Grasses. Deciduus, falling off at the same time with the flower. Tilia Europæa. Dentatus, when the segments on the margin are not deeper than the fourth of the tube.

Duplex, double, as in Malva, Althea, &c. Fissus, when the segments are cut down to the mildle of the tube.

vessels described by Linnæus, viz.—the

Samara, a winged fruit, as in Elm.

Integer, entire, not cut on the margin. Monophyllus, consisting of one leaf. Polyphylum, consisting of two or more leaves. Partitus, divided beyond the middle and near to the base.

Persistens, remaining after the flower falls. Perianthum, when it embraces the flower, as in Primrose, Pink, &c. Involucrum, a cover or fence, when standing remote from the flower, as in Carrot, Hem-

Tock, &c. Spatha, a sheath bursting lengthways, and allowing the flower-stalks to put forth, as in Snowdrop, &c.

Volva, a curtain surrounding the stem and attacked to the pileus or top of many of the Fungi.

PERICARPIUM.

Drupa, a pulpy seed-vessel without valves, inclosing a stone, as in Cherry, Plumb, &c.

Willdenow adds the following :-

Bacca, a berry, pulpy without valves, seeds in the julp, as in Gooseberry.

Ligumen, a membrane of two valves, seeds fixed to one suture, as in Pea.

Lolliewine, a distended membrane of one valve, of any at one side.

Siliqua, a long pod with two valves, seeds attached to both sutures.

Theca, a dry fruit, opening with a lid; and Nux, a nut, as in Hazel.

Strobilus, a set of hard-tiled scales, as in the cone of the Fir.

Lomentum, a two-valved seed-vessel, with cells not opening.

Pepo, a succulent fruit, the seeds attached to the mid.

COROLLA.

1st, The Calvx, or Flower-Cup. The empalement or outer covering of the Flower 2d, The Corolla—the Wreath, Little Crown, or Blossom—the term given by Linis considered by Linnæus to be the termination of the cortical epidermis or outer bark of næus to the heautiful painted leaves of the flower. The most conspicuous part of the surrounding the seed-bud, and constituting one of the flower. The most conspicuous part of the flower (the surrounding the seed-bud, and constituting one of the flower. the plant; which, after accompanying the trunk through all its branches, breaks out with Fructification, standing within, and supported by, the Calyx, is an expansion of the style or shaft, seated on the Germen; and the Stigma or top of the style; covered in the flower, and is present in the fructification in this new form. The Calyx is mostly of liner bark of the plant, generally consisting of three parts,—viz. tubus the tube, faux the viz. the Filament, the Anther, and the Pollen. The Stamens vary as to situation, figure, generally consisting of three parts,—viz. tubus the tube, faux the viz. the Filament, the Anther, and the Pollen. a thick coarse substance, and generally green; while the Corolla is a delicate membrane, throat, and the limbus or expanded part of the blossom. These parts vary as to figure, number, proportionate lengths, and connection. of a much finer texture, and is blue, red, or some other colour distinct from that of the situation, number, &c. Flowers may be of one or more petals or blossom-leaves; and leaves or stem of the plant. The use of the Calyx is seemingly to enclose, defend, support, are termed, Monopetalous, Tripetalous, Tetrapetalous, Pentapetalous, Hexa- to its varied appearances, as

Monopetalous Flowers are termed

Campanulata, gradually widening towards the mouth like a bell. Diformis, when the tube, after expanding, divides into unequal lobes. Lonicera. Hypocrateriformis, when the tube is long, and the rim flat and broad like a salver. Phlox. Geniculatum, bent at the joints like a knee. Incurvum, bent in from the middle, bow-like.

in Dandelion. Globosa, when, like a sphere, it widens out gradually to the middle. Vaccinium. Personata, when both segments of a ringent corolla are close shut up, and the stamer

and the pistils masked. Snap-dragon. Rotata, when the tube is very short, and the rim flat like a wheel. Verbascum. Ringens, corolla having two segments, like the lips of an animal gaping open. Lamium. Tubulosa, when like a hollow pipe of nearly equal diameter. Red Valerian. Unilabiata, upper or under lip of a ringent corolla is wanting-one-lipped. Teucrium.

POLYPETALOUS COROLLAS are termed

Caryophyllacea, when five petals are shaped and disposed as in Clove, Pink, &c. Cruciata, when four petals stand opposite to one another, cross-like, as in Stock, Mustard, &c. Dentata, when there are indentations or teeth on the margin. Irregularis, consisting of two or more petals of different lengths and inclinations. Liliacea, when plants have one, three, or six petals, three or six stamens, a bulbous root, Globosa, round like a globe. Oblonga, diameter greater one way than the other. and leaves with longitudinal fibres, as in the Crocus, Narcissus, Lily, &c.

in Mallows, &c. Papilionacea, butterfly-shaped, having four petals, the vexillum, carina, and the two ale, | Reniformis, shaped like the kidney of an animal. Sagitata, shaped like an arrow.

as in the Pea. Rosacea, when the petals are pretty round, and have no claws at the base, like the Rose. Versitalis, moveable with the wind or any slight cause.

SEMEN. 5th, The Pericarpium is the Seed-Vessel, a developed Seed-Bud, containing the | 6th, The Receptaculum or Recep seeds after fecundation. The Receptacle, or Calyt, performs this office in the Compound | vegetable, rendered fertile by the aspersion of the Pollen. The parts of the Seed are the | the Flower rest; it may be proper or common, bearing one or more flowers. Flowers, and in all the Gymnospermia Plants. There are eight distinct kinds of seed-

Arillus, an ill-defined membrane, covering the seed, and sometimes the pericarpium. Coronula, a little crown or pappus, attached to the seed of the compound flowers. Capsula, capsule, a membraneous vessel containing the seed, of various shapes and divisions. | Corculum, the little heart, consisting of the rostellum and plumulla, the former descends | Conicum, rising to a point in the centre. into the earth and becomes the root, and the latter ascends and becomes the stem. | Convexum, somewhat elevated in the centre.

Cotyledones, the seed-les changing at germination into leaves. Hilum, an external scar or mark, indicating the place of the corculum. Pomum, a fleshy or pulpy seed-vessel, covering a capsule containing the seed, as in Apple. | Tunica externa, the outer integument or covering.

> Tunica interna, the inner integument or covering of the seed. Papeus, down, a feathery or hairy flying crown on the seeds of most compound flowers. Capillaris vel Piliosus, when very fine, like hairs. Paleaceus, chaffy-like scaes or small leaves on the top of the seed.

Plumosus, down divided like a feather. Tragapogon. Setaceus, when covered with rigid bristles. Centurea Negra.

STAMINA.

Articulatum, when there are evident joints or commisures.

Capillare, equal thickness, as fine as a hair. Filiforme, thicker than a hair, thread-like. Conniventia, when several filaments bend to one another at their tops. Cuniforme, compressed, tapering to a point, wedge-like. Dilatatum, broad, widened out.

Declinata, when, without describing a large circle, they turn downwards. Infundibiliformis, an obverse cone, flat and turned out at the rim like a funnel. Datura, Plumosum, feathery—Pilosum, hairy—Nudum, naked—Librum, loose—Connata, joined. Capillaris, slender, like a hair of equal thickness. Ligulata, when a short tube terminates in a long expansion on one side, like a tongue, as Pedicellatum, when standing on foot-stalks, as in Sage.

Subulatum, like an awl, thicker below than above, gradually tapering. The ANTHER is that little bag or cellular body, containing the Pollen or fecundating powder, which, viewed through a magnifying lens, appears hollow, and filled with a subtile fluid, and varying in figure, as

Aristata, slender sharp substances, like awns of Barley. Muticus, awnless, beardless. Adnata, closely attached on both sides to the point of the filament. Apice dehiscens, opening at the top. Latere dehiscens, opening or bursting at the side.

Bifida, cleft, as in the Grapes. Bilocularis, having two cells. Unilocularis, having only one cell. Cristata, crested with cartilaginous points on the sides or base.

Didyma, when double, or like two joined together. Horizontalis, horizontal. Incumbens, lying obliquely on the top of the filament. Malvacea, when five petals are attenuated downwards, so as to unite close at the base, as | Linearis, when long, flat, and of equal breadth, strap-shaped. Peltata, when circular, flat on both sides, and attached by the middle.

Sessile, sitting, having no filament.

RECEPTACULUM.

flat or spherical, dry or hard, soft or fleshy, smooth or covered with hair; and is some- honey of the flower, and affords the best marks of generic distinction. The principal ditimes the esculent part of the fruit, as in the Strawberry, &c. and is termed

Apiculatum, when covered with fleshy erect short points, prickly.

Favosum, when pits, like the cells of a honey-comb, cover the Glabrum, smooth, destitute of hairs or points. Paleaceum, when set with scales or short leaves like chaff.

Pilosum, set with short stiff hairs. Villosum, set with long soft hairs. Planum, flat. Punctatum, when the surface is covered with small punctures. Scorbiculatum, when there are deep round pits on the surface.

Setaceum, covered with rigid bristles. Paleaceum, set with small leaves or scales. Sessilis, sitting on the seel without foot-stalk. Stipitatus, supported by a little foot-stalk. Tuberculatum, when covered with small round eminences, or warty-like substances. Varium, when the centre is smooth, and rim chaffy, hairy, or prickly.

PISTILLUM.

scope, and may vary in number, figure, &c.

The GERMEN or Seed-Bud is

Angiospermia, the seeds contained in a covering. Gymnospermia, the seeds naked. Germen inferum, sive flos superus, when the germen is below the calyx and corolla. Germen superum, sive flos inferus, when the germen is above the calyx or corolla. Monospermum, one; Disperma, two; Tetrasperma, four; Polysperma, many seeds. Pedicellatum, when furnished with a foot-stalk.

Sessile, sitting, when the seed-bud has no foot-stalk. The STYLE or Shaft may be

Clavatus, when thicker above than below, club-shaped. Crassus, gross, when very thick and short. Deciduous, falling off immediately after impregnation. Dichotomus, divided into two branches, each of which is again divided.

Luteralis, attached to the side of the germen. Terminalis, standing at top of germens. Marcescens, first withering, and then faling off. Persistens, when it does not fall off. Multifidus, many cleft.

Setaceus, slender, but ridged like a bristle.

Subulatus, thicker below than above, and sharp-pointed like an awl.

The STIGMA or Summit may be Acutum, terminating in a sharp point. Obtusum, terminating in a blunt point. Capitatum, headed, when hemispherical and flat under.

Concavum, when hollow in the top, like the Violet. Convolutum, when the divisions are rolled inwards. Dentatum, when set with fine teeth. Emarginatum, when flat and notched on the summit.

Pencilliforme, consisting of thick close fleshy fibres, like a pencil. Petaloideum, when it has the appearance of a petal. Revolutum, the divisions rolled backwards. Spiralis, when rolled up like a watch-spring.

Uncinatum, hooked at the point.

NECTARIUM. versities, in form or situation, of this striking appendage may be embraced in the following varieties :-

Barba, short hairs or soft bristles at the opening of the calyx or corolla. Thymus. Calcaratum, when shaped like a cocksum, as in March Violet, &c. Corniculatum, when shaped and crooked like a horn. Delphinium. Cucullum, a hollow bag or hood, as in Aconitum. Cyathiforme, when formed like a cup, embracing the germen. Narcissus. Favosum, when honey-combed, or having pits like a honey-comb. Fritillaria. Fornix, the arch, a small elongation on the tube or throat of the corolla, as in Anchusa. Glandulæ Nectariferæ, small glands or round bodies giving out honey. Cruciform flowers. Plicatum, when some part of the coroll is folded inwards. Statice. Pori Nectariferi, small holes or pores giving out honey, as in Hyacinth. Staminiforme, an appearance like stames, as in Parnasia Palustrus.

A KEY to the Four Grand Divisions of Linnæus' Sexual System of Botany, illustrated by the Indigenous Plants of Great Britain. II.—ORDERS. III.—GENERA.

THE CLASSES are founded upon the number, the proportionate lengths, the connected the vegetable tribes by certain affinities or resemblances, and these By a Species is meant each particular plant belonging to a genus, which retains situation of the Stamens. The first 20 comprehend all the flowers which are obviously her- absence of a seed-vessel, its shape, on the number and connection of the stamens, or resemblances have been made the foundation of Genera, to facilitate the knowledge of its peculiar characteristic marks unchanged when raised from seed. They are,

I.—CLASSES.

maphrodite; the 21st, such plants as have stamen on one flower and pistils on another: in the first 13 classes are taken from the plants. To distinguish the Genera, it is necessary to describe accurately all the seven however, liable to vary, by culture, in colour, and some accidental circumstances. 22d, we find stamens in the flowers of one plant, and pistils in the flowers of another of the lath, from the seeds being naked or covered; the 15th, from parts of fructification; and such a description is termed the generic character. The Specific distinction is founded on peculiarities of the stem, branches, leaves, insame species; in the 23d are found male, female, and hermaphrodite flowers on the same plant; the shape of the seed-vessel; the 16th, 17th, and 18th, from the number of stamens; the essential character of a genus depends upon some peculiarity in the structure of the flower, florescence, roots, the presence of down or thorns, the duration of the and in the 24th class, the parts of fructification are inconspicuous. - The Classes are exemplified | 19th, from the num- in which the plants of a genus agree with one another, and which essentially distinguishes | plant, &c. by, at least, one Genus, with the Natural Order to which it belongs, according to Linnæus' ber and connection of the stamens; the orders of the 24th class are formed of natural them from every other, and is most frequently taken from the calva or corolla, or from " Fragments of a Natural Method." Has 2 Orders Monogynia and Digynia, I and 2 Pistils, 2 do. Mono- and Digynia, 3 do. Mono- Di- and Trigynia,

3 do. Mono- Di- and Tetragynia,..... 4 Tetrandria, 4 do. of equal lengths, ... Rubia, Stellatæ, 7 do. Mono- Di- Tri- Tetra- Penta- Hexa- and Polygynia, 3 do. Mono- Tri- and Polygynia,..... 1 do. Monogynia, 4 do. Mono- Di- Tri- and Tetragynia, 4 do. Mono- Di- Tri- and Dodecagynia, 3 do. Mono- Penta- and Polygynia,.... 12 Icosandria, 20 or more do. on the Calvx..... Pyrus, Pomacea,..... W. Tistigs do. Mono- Penta- and Polygynia, 13 Polyandria, 20 to 1000 do. on the Receptacle, Papaver, Rhæadeæ, do. Gymnospermia and Angiospermia, 2 14 Didynamia, 4 do. 2 long and 2 short, Lamium, Ringentis, 15 Tetradynamia, 6 do. 4 long and 2 short, Cochlearia, Cruciformæ, 16 Monadelphia, all the Filaments united, Malva, Columniferæ, 1 do. Polyandria,.... 3 do. Polygamia, Equalæs, Superflua, and Frustranea, Maces son tien ventrante 19 Syngenesia, 5 Stamens united by their Anters, Anthemis, Compositæ, 20 Gyandria, the Stamens growing on the Pitil, Orchis, Orchideæ, 21 Monoæcia, Flowers with Stamens, others Pitils, on same Plant, Pinus, Conifera, 22 Dioæcia, Stamens on one Plant, and Pistls on another, Salix, Amentacea, 1 do. Monoæcia, 23 Polygamia, both or one sex and herma. flowers on same Plant, Atriplex, Holoracea, 4 do. Felices, Musci, Algæ, and Fungi,

the nectarium when present.

Has 5 Genera, 4 in the 1st Order, and 1 in the 2d, Contains 14 Species, 10 Annuals and 4 Perennials. 11 do. 10 in the 1st Order, and 1 in the 2d, 48 do. 12 in the 1st Order, 33 in the 2d, and 3 in the 3d, 22 do. 14 in the 1st Order, 1 in the 2d, and 7 in the 3d, 97 do. 41 in 1st Order, 45 in 2d, 5 in 3d, 1 in 4th, 3 in 5th, 1 in 6th, & 1 in 7th, 26 do. 19 in 1st Order, 1 in 2d, 5 in 3d, and 1 in 4th, 1 do. Calyx 7 leaved, Corolla 7 parted, equal flat, Berry one-celled, dry,...... 13 do. 9 in 1st Order, 1 in 2d, and 3 in 3d, 1 do. Calyx, Involucre simple, 3 leaved, Cor. 6 petalled, Capsulis 6, seeds many, 20 do. 4 in 1st Order, 5 in 2d, 4 in 3d, and 7 in 4th, 5 do. 2 in 1st Order, 1 in 2d, 1 in 3d, and 1 in 4th,

12 do. 1 in 1st Order, 3 in 2d, and 8 in 3d, 21 do. 8 in 1st Order, 5 in 2d, and 8 in 3d, 33 do. 20 in 1st Order, and 13 in the last, 29 do. 15 in 1st Order, and 14 in 2d,..... 19 do. 1 in 1st Order, 1 in 2d, and 17 in 3d,..... 1 do. Calyx 5 parted, Cor. 5 petalled, Styles 1, 3, or 5, Stamens in 3 or 5 sets, 41 do. 22 in 1st Order, 18 in 2d, and 1 in 3d, 11 do. 9 in 1st Order, 1 in 2d, and 1 in 3d, 25 do. 2 in 1st Order, 5 in 2d, 4 in 3d, 3 in 4th, 10 in 5th, and 1 in 6th, 14 do. 1 in 1st Order, 2 in 2d, 3 in 3d, 1 in 4t, 1 in 5t, 2 in 6t, 2 in 7t, 2 in 8t, 1 do. Hermaphrodite, Calyx 5 leaved, no Corolla, Stamens 5, Style cleft, seed 1,

41 do. 18 in 1st Order, and 23 in 2d, 3d and 4th not enumerated,

Squmæ Nectariferæ, small scales that screte honey, as in Ranunculii.

IV.—SPECIES.

38 do. 9 Ann. 25 Per. and 4 Trees.

162 do. 42 Ann. 3 Biennials, and 120 Per. 63 do. 16 Ann. 2 Bien. 43 Per. and 2 Trees. 217 do. 56 Ann. 23 Bien. 111 Per. and 27 Shrubs.

86 do. 4 Ann. 81 Per. and 1 Shrub. 1 do. Europa.

38 do. 9 Ann. 1 Bien. 15 Per. and 13 Shrubs. 1 do. Umbellatus. 106 do. 24 Ann. 75 Per. and 4 Shrubs.

7 do. 3 Ann. 4 Per. 72 do. 23 Per. 49 Trees and Shrubs. 60 do. 16 Ann. 34 Per. and 10 Shrubs.

87 do. 25 Ann. 2 Bien. and 60 Per. 71 do. 34 Ann. 13 Bien. 23 Per. and 1 Shrub. 21 do. 10 Ann. 1 Bien. and 10 Per.

70 do. 29 Ann. 35 Per. and 6 Shrubs. 11 do. 10 Per. and 1 Shrub. 136 do. 34 Ann. 18 Bien. and 84 Per. 33 do. All Perennials.

416 do. 61 Ann, and 355 Per.

104 do. 10 Ann. 1 Bien. 81 Per. and 12 Trees and Shrubs. 73 do. 1 Ann 6 Per. 66 Trees and Shrubs. 7 do. 6 Ann and 1 Shrub.

Thus I have endeavoured to bring together, and resent to the eye at one view, in a more narrow compass than has hitherto been done, nearly all that is essential to be known, towards prosecuting, with success, the study of Practical Botany; and, should this Breviate happen to excite, in any one, a desire to cultivate an acquaintance with this most delightful science, it may become the source of much pleasure to the examination of plants, will sharpen the powers of discernment, and will ultimately improve the mind, by furnishing it with correct conceptions of the beautiful order and regular succession of the different generations of Vegetables, and of the sublimely-simple, yet inflexible laws, imposed by the Creator and Moral Governor of the Universe upon the Third-Day Volume of his Book.
